

Student Instructions - Projectile Motion Visual and Audio Creation Project

Your task is to make a visual depicting one of the areas of projectile motion and also create an audio description of your visual. Please pay careful attention to the rubric below for expectations regarding this project.

Research should include your text and other resources to cover the many important aspects of the projectile motion problem you will work through. Make sure to cover each aspect of the motion including: time, velocities (x and y as appropriate), displacement, and acceleration. Before you begin your visual or audio make sure you have a good plan that you and your partner agree to in terms of your roles and information you want to be included in your visual. Document your conversation on your wiki page.

You may choose any tools that you wish to create the visual and audio to represent your project but it must be available online. Please put a link to your wiki page and artifact on one of your blog pages. Here is a website that will show you many different tools you could use for this project.
